operating range CNC-milling machine: maximum 1570 x 1290mm

create the draft in your CAD-program according to the size of your material

all round margin of 50mm

if you want to mill two or more objects out of one material, there needs to be a **space of minimum 30mm** between them

recommendation: create your file in AutoCAD

>> here you can work more precisely than with other CAD-programs and the transfer to the milling-program Mastercam works the best

IMPORTANT !

the scale of your drawing needs to be 1:1

place the drawing at the point of origin (X=o, Y=o, Z=o)

use different layers for the various milling depths and name them

delete all unnecessary dots, lines and layers

lines have to be connected exactly

🗩 send your file

email your file to: cnc-fg@hs-wismar.de

save file as dxf, dwg, step or 3dm

labelling: **avoid special characters** ($\ddot{a} \ddot{o} \ddot{u}$; , . : - etc.) in your files' name name the file with the **projects' title** and **your full name**

>> if you want you can check your file with the study version of "Mastercam"

maximum milling depth: 55mm >> for a bigger size split the object appropriate and glue the pieces together afterwards

milling head sizes from 2 - 10mm available >> radii in these diameters are possible
